Netflix Shows Analysis

Task 2 | Findings and business interpretation

Scope: 8,807 unique catalog titles in the assigned dataset. The latest addition date is 2021-09-25. These findings describe the snapshot, not the current Netflix catalog or viewing behavior.

Measure	Result
Movies	6,131 (69.6%)
TV shows	2,676
Most common listed genre	International Movies (2,752 titles)
Leading country attribution	United States (3,690 titles)
Median movie runtime	98 minutes
Median series length	1 season

Cleaning decisions

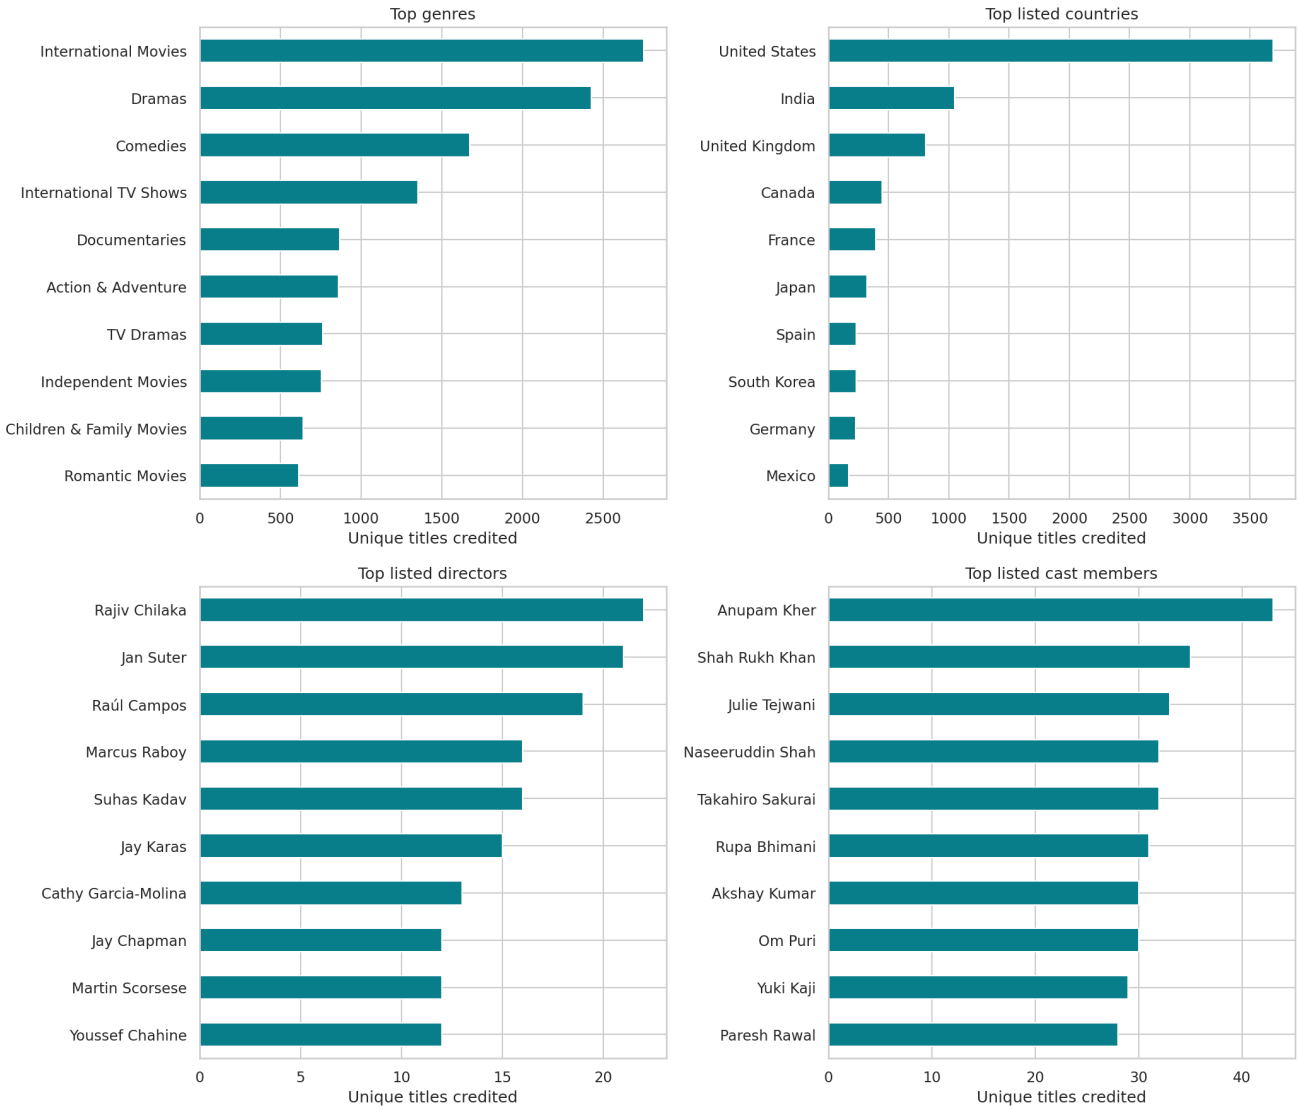

No exact duplicates or repeated show IDs were found. Three movie durations were recovered from the rating field; their ratings remain unknown. There are 10 missing addition dates and 7 unknown ratings after repair.

Missing attribution remains explicit: 831 country fields, 2,634 director fields and 825 cast fields. Fourteen negative release-to-addition year gaps were flagged and omitted from lag summaries, while the titles remained in catalog counts.

Counting rules

Multi-value genres, countries, directors and cast members were split. A title is counted once for each listed entity; category shares are therefore not mutually exclusive. Country credits are not subscriber markets. Minutes and seasons are analyzed separately.

Content and contributor patterns

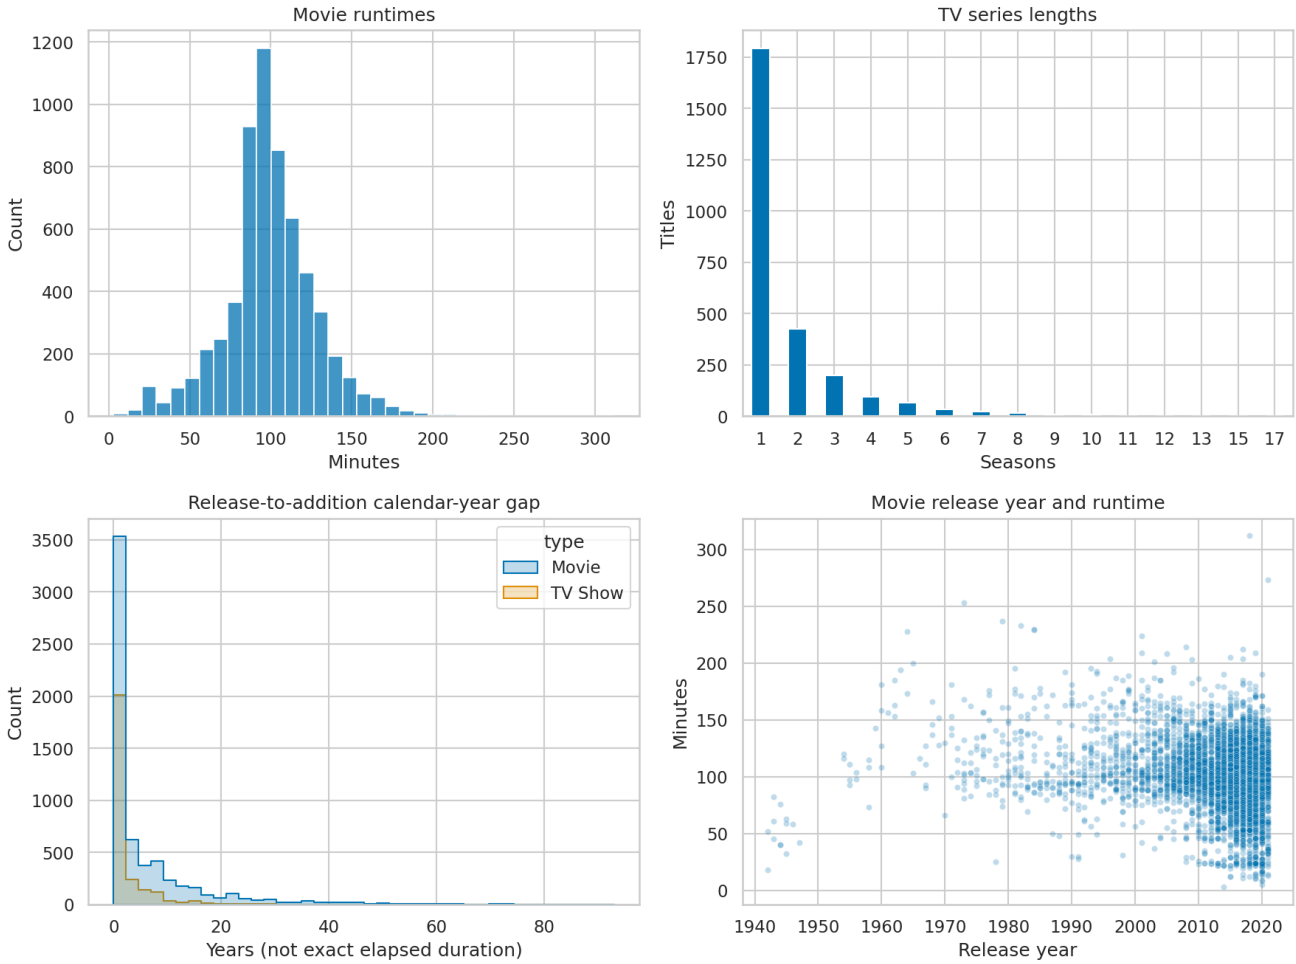

Key findings

Rajiv Chilaka has the most listed director credits (22 unique titles); Anupam Kher leads cast credits (43). Missing contributor fields mean these rankings cover recorded credits only.

TV-MA is the most frequent content rating (3,207 titles). This is a maturity classification, not a viewer score. The mix supports a historical description of catalog positioning, but cannot show what audiences actually watched.

Among full calendar years represented, 2019 has the most addition dates (2,016 titles). The year 2021 is partial, and removals are unavailable; addition counts should not be called net growth.

Duration, timing and conclusions

The median calendar-year release-to-addition gap is 2 years for movies and 0 years for TV shows, after excluding missing and negative gaps. A zero-year gap means the same calendar year, not necessarily simultaneous release.

Movie release year and runtime have Spearman correlation -0.19, a weak negative association in this sample. This is descriptive and does not establish a causal trend. Rating-based runtime comparisons use only movie groups with at least 30 titles.

Practical implication

Use this analysis as a supply-side catalog baseline. Any content-acquisition recommendation should also examine viewing hours, completion, subscriber-market availability and licensing costs. The snapshot cannot establish profitability, demand or Netflix's causal decision process.
